Ringinspector

Visual inspection of inside surface quality and shape of ironing dies for beverage can manufacture

The RINGINSPECTOR provides fatigue free and detailed inspection of the inside surface of each kind of ironing die.

Using a stereo zoom microscope and a special illumination, a high contrast image is provided to the operator.

The mechanical setup enables the exact positioning of the die. The die is mounted on two stable bearings, which enables the rotation of the die very easily and sensitive. During rotation the inside surface

remains constantly in the image plane of the microscope.

According the inside form of the die, different viewing angles can be adjusted.

The RINGINSPECTOR can be adapted to all die sizes.

The stereo zoom microscope has a large zoom factor. With low magnification the operator has an overview on the inside die quality. With high magnification each detail can be inspected.

The RINGINSPECTOR is the perfect completion of the tool room equipment!
